 Document 7: Microfilm of the specification and drawings annexed to the written application of Japanese Utility Model Application No. 120748/1985 (Laid-open No. 29784/1987) (Fuji Electric Co., Ltd.), 23 February, 1987 (23.02.87)

The subject matters of claims 1-5 do not appear to involve an inventive step in view of documents 1-3 cited in the ISR. (A) The synchronous rectification system DC-DC converter power supply described in document 1, in which (1) a first switching power supply means and a second switching power supply means with a commonly connected input are provided, and (2) the output of a first drive means of the first switching power supply means is used to drive a third switching means connected in parallel to a second rectification means of the second switching power supply means, for synchronous rectification action, and (B) the first and second switching power supply means connected in parallel to each other described in document 2, in which a common oscillation/control means is used to drive first and second switching elements, belong to technical fields closely related to each other. So, a person skilled in the art could have easily conceived of applying the drive of first and second switching elements by a common oscillation/control means described in document 2, to the synchronous rectification system DC-DC converter having first and second switching power supply means of document 1.

Furthermore, document 1 (Fig. 4) also discloses a constitution having the first switching power supply means and the second switching power supply means with a commonly connected input, in which the OFF period of one switching element includes the OFF period of the other switching element.

Moreover, document 1 ([0037]) also discloses that two or more switching power supply means with a commonly connected input are provided.
